

Strut Braces

67000 series

Stiffer is better!

A strut brace works by linking the shock towers, which eliminates flexing during cornering. However, any performance gains are lost if the strut brace also flexes.

The 67000 series billet style strut brace is stiffer than other promotional tubular braces. Made of aircraft-quality aluminum, these strut tower braces improve chassis rigidity and steering response, and are a must for cars with lowered suspensions or "plus" tire/wheel combinations.

Powder-coated end plates feature adjustable hardware, making installation a snap even if you are not a backyard mechanic. These braces come in a highly polished finish, with some fitments also available in a carbon fiber-look finish, and look great in any engine compartment.

New PT Cruiser Application

67204

Designed for applications where special bends are required, these tubular strut braces are made of heavy gauge stainless steel, polished to a mirror-like finish.

63000 series

Crafted of tubular aluminum, these strut braces come either polished or in a carbon fiber-look finish. Adjustable hardware makes for an easy installation, and the powder-coated end plates provide a finished look.
